power. This is avoided by the use of automatic excitation regulation on the condensers (without intensivity zone) acting on voltage deviation, angle of lead or current deviation. This enables using synchronous condensers of a rating not exceeding 0.25 of the transmitted power. The authors present the equations developed for the system and in an appendix present mathematical correlations characterizing the method of calculation. Three appendixes, 17 oscillograms and diagrams, 8 Soviet references (1940-1955).

AUTHOR:	Litkens, I. V.	
TITLE:	Investigation of certain problems of technical stability of an automatically regulated electric system	
PERIODICAL:	Referativnyy zhurnal, Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, no. 2, 1963, 59 - 60, abstract 2A369 (Dokl. 4-y Mezhvuz. konferentsii po primeneniyu fiz. i matem. modelirovaniya v razlichn. otraspelyakh tekhn. Sb. 4. Moscow, 1962, 381 - 391)	
TEXT:	The author considers the problem of the stability margin and stability boundaries of an automatically regulated nonlinear electric system under finite perturbations. The results of theoretical and experimental investigations of the formulated problem are briefly set forth. The investigations were carried out for the case of free and forced motions of the system. It is indicated that in the case of free motions there exists a so-called critical amplitude which, when exceeded by the system makes the latter unstable. The critical amplitude and, consequently, the stability margin are defined by the initial	
Card 1/2		

Investigation of certain problems of...	S/ 71/63/000/002/012/030 AO 0/A126		
static mode; the critical amplitude may be determined from the results of the static analysis of the investigated system. Recommendations are given as to the method of construction for the regulated system which defines the initial static mode. Under steadily acting perturbations there also exists some limiting value of perturbation which when exceeded causes the system to lose its stability. It is noted that the domains of static (under small perturbations) and dynamic (under finite perturbations) stability do not coincide in the parameter space of the system. Recommendations are given for the choice of construction within the limits of the domain of static stability. The entire analysis is performed using the example of an automatically regulated exciter system.	L. T.

TITLE: Seminar-symposium on the usage of the direct (second) method of Lyapunov in power engineering

SOURCE: AN SSSR. Izvestiya. Energetika i transport, no. 6, 1965, 145-148

TOPIC TAGS: electric power engineering, electric engineering conference

ABSTRACT: The symposium was held at the Siberian Scientific Research Institute for Power Engineering (Novosibirsk) 9-12 June 1965. The goals of the seminar were: 1) to reflect the progress achieved in the development of Lyapunov's second method and its applications; 2) to discuss the practice of application of the second method in power engineering; 3) to discuss the prospects for development of the methods of Lyapunov and their application to power design; 4) to aid in popularizing and introducing the effective Lyapunov methods in power system engineering practice. In all, 21 reports were read, including 11 dedicated to the application of Lyapunov's second method to stability theory problems. 10 reports were dedicated to the application of Lyapunov's methods and the development of other methods for analysis of the stability of power systems. Abstract : Experiments were conducted on hypophysectomized and intact
frogs. After hypophysectomy, the frogs were sluggish,
with sharply decreased motor functions and lowered reac-
tion to external stimuli. Hexanal was introduced subcu-
taneously in a dosage of 4-40 γ/kg and chloral hydrate 40-
400 γ/kg. Duration and depth of narcosis in hypophyso-
sectomized frogs is greater than in intact frogs.

TITLE: Compensating the error of a ferroprobe gradiometer

SOURCE: USSR. Gosudarstvennyy geologicheskiy komitet. Osoboye konstruktorskoye byuro. Geofizicheskaya apparatura, no. 26, 1965, 29-32.

TOPIC TAGS: gradiometer, gradient meter, ferroprobe, magnetometer, ferroprobe magnetometer

ABSTRACT: When a differential magnetometer is used as a gradient pickup in a ferroprobe gradiometer, the resultant methodical error can only be determined by approximation. This error is attributed to misalignment of the axes of the ferroprobes used, and the following recommendations are proposed for compensation:

1) the probes should be rigidly fixed in a common block to insure stable and parallel alignment, and 2) the remaining error should be compensated by a third auxiliary probe mounted perpendicular to the measuring axis of the gradiometer with a rotating degree of freedom that coincides in direction with the axis. A diagram showing the disposition of the probes is given in Fig. 1. The most accurate compensation is attained with dc. In aligning the system, the block of probes is oriented in a horizontal plane in the north--south direction. By rotating the

chlorosilane in petroleum ether and tert.-butyl hydroperoxide in the presence of pyridine. The structure of the peroxide produced was confirmed by its reduction. I) Di-tert.-butyl peroxide methyl vinyl-silane $\text{CH}_2=\text{CH}-\text{Si}(\text{CH}_3)_3[-\text{OO}-\text{C}(\text{CH}_3)_2]_2$. II) Di-tert-butyl peroxide vinyl ethyl silane $\text{CH}_2=\text{CH}-\text{Si}-(\text{C}_2\text{H}_5)[- \text{OO}-\text{C}(\text{CH}_3)_2]_2$ was formed in a similar reaction from vinyl ethyl dichloro silane. III) Tri-tert.butyl peroxide vinyl-silane $\text{CH}_2=\text{CH}-\text{Si}[-\text{OO}-\text{C}(\text{CH}_3)_3]_3$ was produced in the same way from vinyl trichloro silane. The four peroxides synthetized are transparent liquids. Molecular weights, determined (calculated): I - 179 (188.32); II - 243.5 (248.37), III - 256 (262.4), IV - 317 (322.57). II, III, and IV decompose under explosion at 150.5°C, 159°C and 147.5°C, respectively,. The peroxides mentioned are recommended in Refs. 3 and 4 as initiators of polymerization and as oxidizers. AUTHORS: Litkovets, A. K., and Yurzhenko, T. I.

TITLE: Synthesis of unsaturated organosilicon peroxides

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 142, no. 6, 1962, 1316 - 1318

TEXT: Unsaturated organosilicon peroxides of the structure $\text{CH}_2=\text{CH}-\text{SiR}_m-\text{[-OO-C(R)]}_n$ ($m+n=3$; $n=1,2$) with saturated and unsaturated radicals on the silicon atom and on the tertiary C atom were synthesized. Peroxides of this type have a high thermal stability ($150 - 170^\circ\text{C}$) and are, therefore, suited for vulcanization processes and high-temperature polymerizations. Mono-tert-amyl peroxide vinyl methyl ethyl silane $\text{CH}_2=\text{CH}-\text{Si}(\text{CH}_3)(\text{C}_2\text{H}_5)\text{OOC}(\text{CH}_3)_2\text{C}_2\text{H}_5$ was produced from tert-amyl hydroperoxide and vinyl methyl ethyl chlorosilane as follows: A solution of vinyl methyl ethyl chlorosilane (0.1 moles) in 100 ml petroleum ether (boiling range $<40^\circ\text{C}$) was cooled to -3°C , and mixed dropwise with a mixture of 0.1 M tert-amyl hydroperoxide and 0.1 M pyridine in 50 ml of petroleum ether. Accompanied by vigorous stirring, the reaction temperature was kept below \checkmark

B106/B101

0°C. Then the reaction mixture was kept at room temperature for 3 hrs. After this, the pyridine hydrochloride was dissolved in a little water and separated off. The organic layer was washed, dried, and then vacuum distilled. The peroxide yield was 59%. The product was redistilled and showed the following characteristics: liquid with light camphor odor; b. 38°C (1-2 mm); n_D^{20} 1.4308; d_4^{20} 0.8763. Hydrolysis of this peroxide in the presence of hydrochloric acid yielded tert-amyl hydroperoxide and vinyl methyl ethyl silanol. Reduction of the peroxide with potassium iodide in acid solution or with sodium sulfite in neutral solution yielded tert-amyl alcohol and vinyl ethyl silanol. Further, the following peroxides were synthesized in a similar manner: Monocumyl peroxide vinyl methyl ethyl silane $\text{CH}_2=\text{CH-Si}(\text{CH}_3)(\text{C}_2\text{H}_5)\text{OOC}(\text{CH}_3)_2\text{C}_6\text{H}_5$; 43% yield; oily liquid; b. 55°C (0.1 mm); n_D^{20} 1.4910; d_4^{20} 0.9656. Di-tert-butyl peroxide vinyl propyl silane $\text{CH}_2=\text{CH-Si}(\text{C}_3\text{H}_7)[-00-\text{C}(\text{CH}_3)_3]_2$; 45% yield; b. 76°C (1-1.5 mm); n_D^{20} 1.4269; d_4^{20} 0.9054. Di-tert-amyl peroxide vinyl methyl silane $\text{CH}_2=\text{CH-Si}(\text{CH}_3)[-00-\text{C}(\text{CH}_3)_2\text{C}_2\text{H}_5]_2$; 58% yield; b. 62°C (0.5-1 mm); n_D^{20} 1.4312; \checkmark

Synthesis of unsaturated...

d_4^{20} 0.9228. Di-tert-amyl peroxide vinyl propyl silane
 $\text{CH}_2=\text{CH}-\text{Si}(\text{C}_3\text{H}_7)[-\text{OO-C}(\text{CH}_3)_2\text{C}_2\text{H}_5]_2$; 66% yield; b. 56°C (0.05 mm);
 n_D^{20} 1.4359; d_4^{20} 0.9145. Di-tert-butyl peroxide allyl methyl silane
 $\text{CH}_2=\text{CH-CH}_2-\text{Si}(\text{CH}_3)[-\text{OO-C}(\text{CH}_3)_3]_2$; colorless liquid with satisfactory thermal stability; noticeable development of gas bubbles starting at 158°C and ending at $191 - 192^\circ\text{C}$; 40% yield; b. 31°C (0.1 mm); n_D^{20} 1.4182;
 d_4^{20} 0.9094. In addition, the attempt was made to obtain analogous peroxides with two peroxide groupings in a pure form also with cumene hydroperoxide. These peroxides could, however, not be distilled by fractional distillation (0.01 mm) on a boiling water bath. Isolation of these peroxides by freezing them out of their solutions was also not possible. After distilling off the solvent, the peroxides were obtained in the form of concentrates with a content of 65 - 70% of pure product. Positive results were achieved when testing them in the vulcanization of various rubber mixtures. There are 3 references: 2 Soviet and 1 non-Soviet. AUTHOR: Litkovets, A. K.; Yurzhenko, T. I.

TITLE: Investigating the rate of thermal decomposition of organosilicon peroxides

SOURCE: AN SSSR. Doklady*, v. 154, no. 3, 1964, 679-682

TOPIC TAGS: unsaturated organosilicon peroxide, organosilicon mono-peroxide, organosilicon diperoxide, organosilicon triperoxide, thermal stability, thermal decomposition, solvent effect, unsaturated alkylsilane peroxide, high temperature polymerization, vulcanization, decomposition rate

ABSTRACT: A systematic study was made of the thermal stability of unsaturated organosilicon peroxides containing 1, 2 or 3 peroxide groups on the Si atom. Decompositions were conducted under a nitrogen atmosphere at 120, 130 and 140°C in isopropylbenzene, ethylbenzene, and toluene containing 0.2M active oxygen per liter of solution. The

Card 1/4

ACCESSION NR: AP4013335

following compounds were investigated: tert.-butyl- (I), cumyl- (II) and tert.-amyl- (III) monoperoxides of methylvinylethylsilane; di-tert.-butyl peroxides of methylvinylsilane (IV), vinylmethylethylsilane (V), vinylpropylsilane (VI), and methylallylsilane (IX); di-tert.-amyl peroxides of methylvinyl silane (VII) and vinylpropylsilane (VIII); and, the tri-tert.-butyl peroxide of vinyl silane (X). The rate constant increases in solvents with lowered activity, i.e., it is greater in toluene than in ethylbenzene and isopropylbenzene. From Figs. 1 and 2, it is seen that the monoperoxides and the di-peroxide of the allyl silane do not decompose according to the first order equations and the stability of (III) is much lower than that of (I) and (II). It is also seen that the di- and tri-peroxides follow the rule of monomolecular reactions and the triperoxide is least stable. The electronegativity of the Si is increased by the accumulated peroxides groups. The nature of the alkyl substituents is that it affects the stability of Si and the peroxide. It was found that with the tert.-butyl group the effect on the peroxide is that the compounds are more stable than with the tert.-amyl; and the

Card 2/4

ACCESSION NR: AP4013335

effect of the alkyl radicals on the Si is that it increases stability in proportion to their positive inductive effect on the Si propyl more than Si methyl, and more than Si ethyl. This information should be helpful in selecting compounds for use in high-temperature polymerization and vulcanization processes. Orig. art. has: 2 figures and 2 tables.

Periodical : Vest. svyazi 8, 8-9, Aug 1954

Abstract : The "IR-2" instrument used for testing dischargers of the RA(PA) and RB(PB) types, carbon-type and other type dischargers installed on communication lines, is described. The difference between the "IR-2" testing instruments and the earlier "IR-49" instrument is outlined and the relative advantages of the former (IR-2) type explained. The method of assembly and operation of the instrument is demonstrated and an operation chart is included. Diagrams; illustration; table.

ABSTRACT: With respect to the article published in Avtomatika i Telemekhanika, 1954. Vol 15. Nr 6 by A.S. SADOVSKIY on "Passage Induction Donors" it is said that the attempt to realize the results obtained by SADOVSKIY in practice did not lead to the expected results. The theoretical computations, which served as a basis for the investigation, contained a number of basic errors, by which practically all the conclusions drawn by SADOVSKIY are proved to be wrong. The following are the most important errors:
1. No account is taken of a) the resistance of the ferromagnetic domain of the magnetic circuit, and b) of the difference in density of the magnetic lines of force in the air gap.
2. It is assumed that the lines of force of the magnetic field have the shape of an ellipse.
3. Teeth are of different heights.

In addition, three mathematical errors are pointed out. It is not

Card 1/2

Letter to the Editor.

PA - 2839

clear why just this and no other donor, which the author did not recommend to be used, is investigated. Besides, theoretical results are not compared with the curves obtained by experiments.

TITLE:

On the Radiation Synthesis of the Copolymer of Akrylonitrile
With Propylene

PERIODICAL:

Izvestiya Akademii nauk SSSR. Otdeleniye khimicheskikh nauk,
1959, Nr 8, p 1507

ABSTRACT:

As is known, gaseous olefines do not easily polymerize under the influence of γ -rays. The authors proved this fact also for propylene, which does not polymerize in a condensed state at room temperature and a radiation dose of $\sim 5 \cdot 10^6$ roentgen. It was tried to copolymerize the easily polymerizing akrylonitrile with propylene under the influence of γ -rays. The mixture of the two monomers was subjected to an integral radiation dose of $5 \cdot 5 \cdot 10^6$ roentgen (γ -Co⁶⁰). The product obtained was extracted successively with dimethylformamide, n-heptane, and ether. The percentage of propylene links in the copolymer was determined from the elementary analysis of the remaining residue. At a change of the weight ratio of propylene and akrylonitrile from 0.75 to 0.15 the percentage of propylene links in the copolymerizate

Card 1/2

On the Radiation Synthesis of the Copolymer of
Akrylonitrile With Propylene

SOV/62-59-8-38/42

decreases from 26 to 12%. The same copolymer was obtained by thermal copolymerization in the presence of benzoylperoxide at 75°. In this case the percentage of propylene links in the copolymer at a weight ratio propylene : akrylonitrile = 0.3 was 17%. There is 1 reference.

TITLE: Fractionation of copolymers. Effect of the composition
on phase interactions

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 147, no. 6, 1962,
1389-1391

TEXT: This is a theoretical study of the fractionation, through
temperature reduction, of a polydisperse, inhomogeneous, and linear
copolymer dissolved in an individual solvent. On the basis of Flory's
theory of polymer fractionation the following change in free energy is
obtained when dissolving this copolymer: $\Delta F_m = RT(n_1 \ln v_1 +$

$\sum_{r,\alpha} n_{r,\alpha} \ln v_{r,\alpha} + n_1 \sum_{r,\alpha} v_{r,\alpha} \chi_\alpha)$, where n_1 and v_1 are the number of
molecules, and the part by volume of the solvent, respectively, $n_{r,\alpha}$ and

Card 1/3

S/020/62/147/006/027/034
B144/B101

Fractionation of copolymers. . .

$v_{r,\alpha}$ are parameters equal for the component with the polymerization degree r and the composition α , α is the portion of A members in the copolymer AB, and χ_α is the parameter of interaction between solvent and the macromolecules of the composition α . $\ln(v'_{r,\alpha}/v_{r,\alpha}) = r[\bar{\sigma} + (v'_2 - v_2)\chi_\alpha]$,

where $v'_{r,\alpha}$ and $v_{r,\alpha}$ are the parts by volume of the component $[r,\alpha]$ in the deposit and in the solution, respectively, is obtained on the assumption that the solution separates into two phases (deposit and dilute solution) on temperature reduction. The distribution of this component depends, therefore, not only on the chain length but also on the composition. $\ln \varphi_{r,\alpha} = r(\bar{\sigma} + K\alpha)$ was obtained from $\chi_\alpha = \chi_A \alpha + \chi_B (1 - \alpha)$; $\varphi_{r,\alpha} =$

$v'_{r,\alpha}/v_{r,\alpha}$; $\bar{\sigma} = \bar{\sigma} + \chi_B (v'_2 - v_2)$; and $K = (\chi_A - \chi_B)(v'_2 - v_2)$, where χ_A and χ_B are the parameters of interaction between solvent and A and B respectively, and v'_2 , v_2 are the total polymer contents in the deposit

Card 2/3

Fractionation of copolymers. ...

S/020/62/147/006/027/034
B144/B101

and solution respectively. This equation shows that the distribution of components depends on their composition at equal chain lengths. An increase in molecular weight increases this effect. The portions of the component $[r,\alpha]$ in the solution and in the deposit after phase separation, are obtained from $f_{r,\alpha} = 1/[1 + R \exp r(\sigma + K_\alpha)]$ and $f'_{r,\alpha} = 1/[1 + (1/R) \exp - r(\sigma + K_\alpha)]$, where $R = V'/V$, with V' and V being the volumes of concentrated and dilute phases in equilibrium.

TITLE: The fractionation of the methyl metacrylate copolymer with styrole

SOURCE: Neftekhimiya, v. 3, no. 3, 1963, 343-347

TOPIC TAGS: copolymer, fractionation methylmetacrylate, styrole, n-hexane, methanol, toluol, acetonitrile-toluol, n-hexane, styrole

ABSTRACT: The fractionation of methylmetacrylate copolymer with styrole in the two system solvent-precipitator which are essentially different in sensitivity to the composition of copolymer has been investigated. The two systems selected for the fractionation of copolymer of the composition Alpha = 0.23 where Alpha = molar composition of styrole links in the copolymer, were Eta-hexane plus metanol in the ratio 0.8 : 1 in toluol, and acetonitrile - toluol. The values of differential functions w (Eta) and integral function I (Eta) (where Eta is the characteristic viscosity) of the weight distribution of the original sample according to (Eta) are calculated from the fractionation data. The values W (Eta) and I (Eta) essentially depend on the character of

Card 1/2

L 13512-63

ACCESSION NR: AP3002774

the solvent - precipitator system. In the system Eta - hexane plus methanol - toluol a asymmetric curve $w(\text{Eta})$ was obtained corresponding to the expected molecular weight distribution of the initial copolymer. The system acetone - toluol has a bimodal curve $w(\text{Eta})$. These results agree with the theoretical calculations unimodal. Orig. art. has: 2 tables and 3 graphs.

TITLE: Composition heterogeneity of styrene-methyl methacrylate copolymers

SOURCE: Vysokomolekulyarnyye soyedineniya, v. 6, no. 8, 1964, 1541

TOPIC TAGS: macromolecular chemistry, polystyrene, acrylic plastic

ABSTRACT: The applicability of the inhomogeneity criterion Q/Q^0_{\max} (Q^0_{\max} is the maximum inhomogeneity corresponding to a mixture of A and B homopolymers with $M_A = M_B = M_W$) in the case of $P \neq 0$ was investigated. The dependence of Q_{\max}/Q^0_{\max} on P/P_{\max} was studied for two cases: $P > 0$ and $P < 0$, indicating that the difference between Q_{\max} and Q^0_{\max} must be considered when $P/P_{\max} > 0.1$ (for $P > 0$). The degree of composition inhomogeneity of Q/Q_{\max} of samples of statistical copolymers of styrene with methyl methacrylate, produced at 60° under various conditions: in bulk, in benzene solution, in the case of different compositions of the initial mixture of monomers, and within a broad range of degrees of conversion, was studied by

TITLE: Experimental investigations into the reflectivity of structures at the water area of a sea port

SOURCE: Moscow. Inzhenerno-stroitel'nyy institut. Sbornik trudov, no. 51, 1966.

TOPIC TAGS: marine engineering, ^{STRUCTURAL} engineering structure, fluid dynamics, sea water ,
GENERAL CONSTRUCTION

ABSTRACT: Each structure erected within a port reflects waves approaching it. When waves are reflected the intensity of wave disturbance in the water area of the port increases, therefore when designing the profile of port structures and their building sites this must be taken into account to reduce wave action in the port. Since the existing methods of determining the magnitude of reflectivity of slopes have many shortcomings and do not permit calculating the height of the reflected wave at any distance from the slope at various directions of wave approach, experiments were carried out in a tank to investigate the reflectivity of slopes at their various

angles and normal approach of waves. To create a three-dimensional picture, a model was constructed with symmetrically diverging walls. Guide walls extended from the wave producer to the inlet of the tank to avoid the effect of diffraction arising at the inlet. The propagation velocity of the waves in the model was the same as with a constant cross section of the tank. The depth of the water was 30 cm; height of the initial wave at the inlet to the tank was 8.3 cm, its length 125 cm, curvature $h/\lambda = 1/15$, and relative length $\lambda/H = 4.0$. The height of the approaching wave was taken to be that at the slope before the moment of the first reflection. Wave heights were measured by resistance sensors with the readings displayed on the tape of an oscilloscope. The wave length during each experiment was maintained constant. The points of measuring the heights of the waves were situated along the tank in lines of diffraction parallel to the axis of symmetry at 1-m intervals. The oscillographic recording was broken down into stages: 1) start of wave disturbance; 2) start of recording of first reflection; 3) the turn of the reflected wave to the shield of the wave producer. The experiment confirmed the opinion that the decay of a reflected wave with distance from the slope has a smooth character and the wave decays at an appreciable distance from the slope. The experimental curves of the dependence of the coefficient of reflection on the arrangement of the slope yielded a qualitative picture of the phenomenon for the conditions of the model used. For generalized quantitative characteristics of the reflectivity of slopes, additional experiments need be carried out at various ratios of the wave parameters and, especially, data are needed on full-scale instrumented observations carried out in the ports themselves. Orig. art. has: 4 figures.
